

# Hands on AI based 3D Vision

## Summer Semester 26

Lecture 2 – Image Formation

Prof. Dr.-Ing. Gerard Pons-Moll

University of Tübingen / MPI-Informatics

EBERHARD KARLS  
UNIVERSITÄT  
TÜBINGEN

# Overview

- Part1. Image formation – Introduction
- Part2. Image formation – Projection Matrix

# Computer Vision goal: Predict 3D world from a single image

Input (2D)

Output (3D)

# Computer Graphics goal: Render photorealistic images

Output (2D)

Input (3D)

# For both problems we need to understand first image formation models

Robert Collins  
CSE486, Penn State

## Imaging Geometry

# The laws of perspective

---

## common assumptions

1. Light leaving an object travels in straight lines.
2. These lines converge to a point at the eye.

## natural perspective (Euclid, 3rd c. B.C.)

- 3a. More distant objects subtend smaller visual angles.

# The laws of perspective

---

- ◆ natural perspective (Euclid, 3rd c. B.C.)
  - 3a. More distant objects subtend smaller visual angles.

# Roman wall paintings

---

from Villa Publius Fannius Synistor,  
Boscotrecase, Pompeii (c. 40 B.C.)

Still life with peaches, from  
Herculaneum (before 79 A.D.)

# The laws of perspective

---

## common assumptions

1. Light leaving an object travels in straight lines.
2. These lines converge to a point at the eye.

## natural perspective (Euclid, 3rd c. B.C.)

- 3a. More distant objects subtend smaller visual angles.

## linear perspective (Filippo Brunelleschi, 1413)

- 3b. A perspective image is formed by the intersection of these lines with a “picture plane” (the canvas).

# The laws of perspective

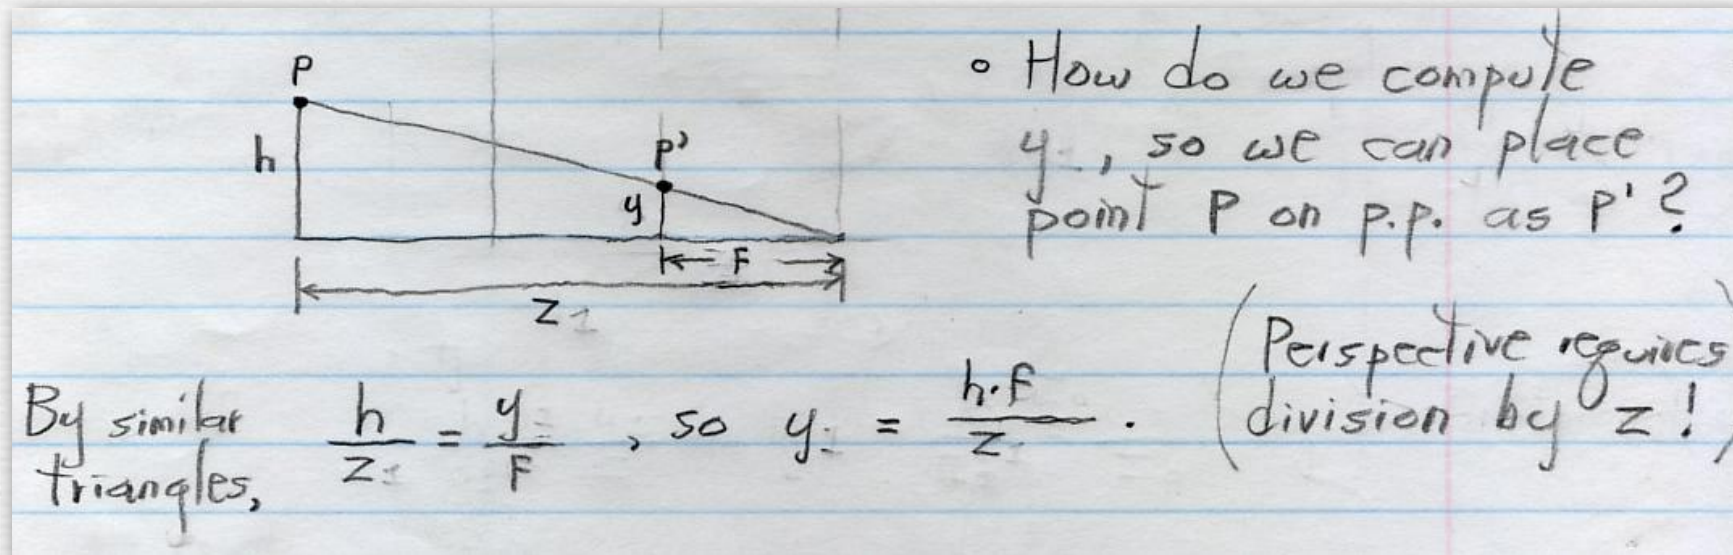

$$\frac{y_2}{y_1} \neq \frac{\theta_2}{\theta_1}$$

- ◆ natural perspective (Euclid, 3rd c. B.C.)
  - 3a. More distant objects subtend smaller visual angles.
- ◆ linear perspective (Filippo Brunelleschi, 1413)
  - 3b. A perspective image is formed by the intersection of these lines with a “picture plane” (the canvas).

# Projection onto picture plane (contents of whiteboard)

---

the division by  $z$  means that the size of an object in a photograph is inversely proportional to its distance from the camera

# Vanishing points

*Q. How many vanishing points can there be in a perspective drawing?*

1-point

2-point

3-point

(D'Amelio)

© Marc Levoy

Q. Should the distant ends of a long facade be drawn smaller than its center in a perspective drawing?

---

Pause the video and think

Q. Should the distant ends of a long facade be drawn smaller than its center in a perspective drawing?

---

?

Should it look like this picture?

Q. Should the distant ends of a long facade be drawn smaller than its center in a perspective drawing?

---

?

- ◆ no, in linear perspective straight lines remain straight
- ◆ lines parallel to the picture plane do not converge
- ◆ they appear smaller when you view the drawing, due to natural perspective (angles subtended at eye)

**Q. Why does this perspective drawing look distorted?**

---

(Dubery)

Q. Why does this perspective drawing look distorted?

---

(Dubery)

- ◆ it's not distorted; it's a correct linear perspective
- ◆ you're viewing the drawing from too far away

# Recap

---

- ◆ natural perspective
  - visual angle subtended by a feature in the world
- ◆ linear perspective
  - intersections of lines of sight with a picture plane
  - the correct way to make a drawing on a flat surface
- ◆ vanishing points
  - one per direction of line in the scene
  - lines parallel to the picture plane do not converge

**Questions?**

# Single lens reflex camera (SLR)

---

Nikon F4  
(film camera)

# Why not use sensors without optics?

---

(London)

# Pinhole camera (a.k.a. *camera obscura*)

2D planar  
geometric  
projection

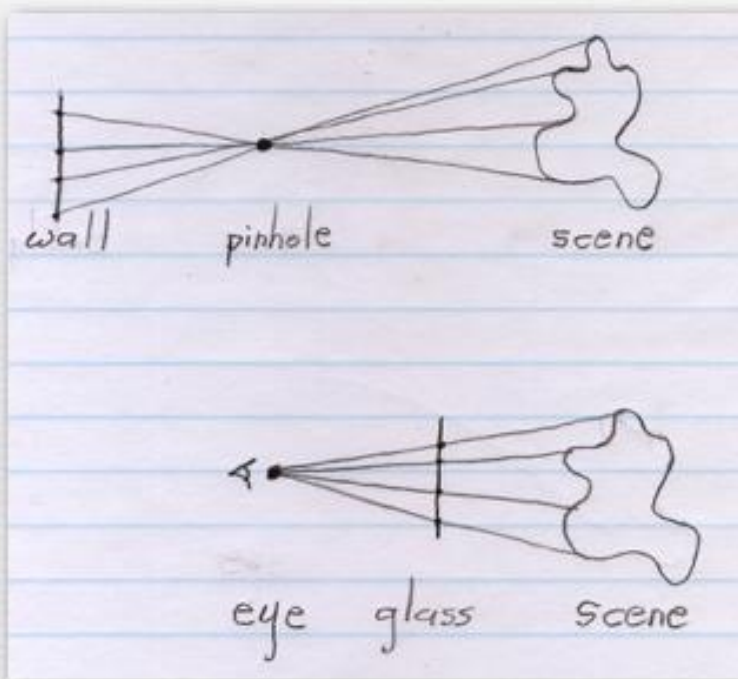

- ◆ linear perspective with viewpoint at pinhole
- ◆ tilting the picture plane changes the number and location of vanishing points

# Equivalence of Dürer's glass and *camera obscura* (contents of whiteboard)

---

*camera obscura*

Dürer's glass

- ◆ both devices compute 2D planar geometric projections,  
i.e. projections along straight lines through a point and onto a plane
  - the images differ only in scale (and a reflection around the origin)

# Effect of pinhole size

---

Photograph made with small pinhole

Photograph made with larger pinhole

(London)

© Marc Levoy

# Effect of pinhole size

---

Photograph made with small pinhole

Photograph made with larger pinhole

(London)

© Marc Levoy

# Replacing the pinhole with a lens

Photograph made with small pinhole

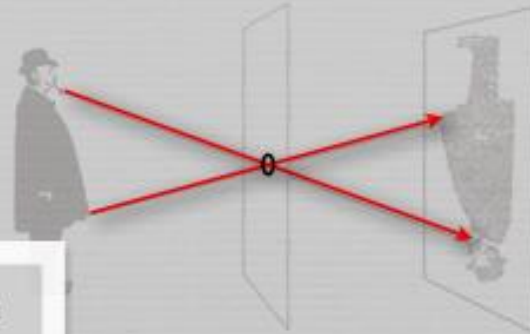

Photograph made with lens

(London)

# Replacing the pinhole with a lens

Photograph made with small pinhole

- ◆ a photographic camera produces the same 2D planar geometric projection as a *camera obscura*
  - a lens replaces the pinhole, and film or a digital sensor becomes the picture plane
  - rotating the camera (and lens) around the lens's center adds or removes vanishing points

(London)

# Geometrical optics

---

- ◆ parallel rays converge to a point located at focal length  $f$  from lens

- ◆ rays going through center of lens are not deviated
  - hence same perspective as pinhole

# Gauss's ray tracing construction

---

- ◆ rays coming from points on a plane parallel to the lens are focused to points on another plane parallel to the lens

# Changing the focus distance

---

- ◆ to focus on objects at different distances, move sensor relative to lens
- ◆ in a handheld camera, one actually moves the lens, not the sensor

by convention, the “focus distance” is on the object side of the lens

# From Gauss's ray construction to the Gaussian lens formula

---

- ◆ positive  $s_i$  is rightward, positive  $s_o$  is leftward
- ◆ positive  $y$  is upward

# From Gauss's ray construction to the Gaussian lens formula

---

$$\frac{|y_i|}{y_o} = \frac{s_i}{s_o}$$

# From Gauss's ray construction to the Gaussian lens formula

$$\frac{|y_i|}{y_o} = \frac{s_i}{s_o} \quad \text{and} \quad \frac{|y_i|}{y_o} = \frac{s_i - f}{f} \quad \dots$$

$$\frac{1}{s_o} + \frac{1}{s_i} = \frac{1}{f}$$

# Changing the focus distance

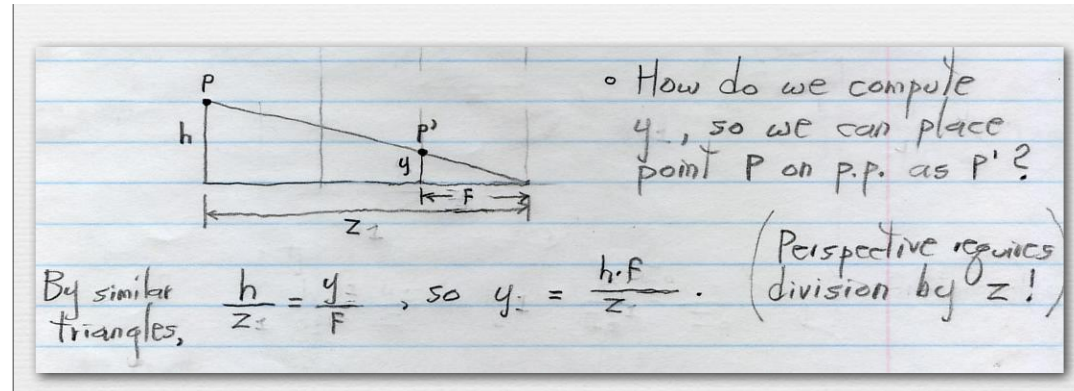

- ◆ to focus on objects at different distances, move sensor relative to lens
- ◆ in a handheld camera, one actually moves the lens, not the sensor

by convention, the “focus distance” is on the object side of the lens

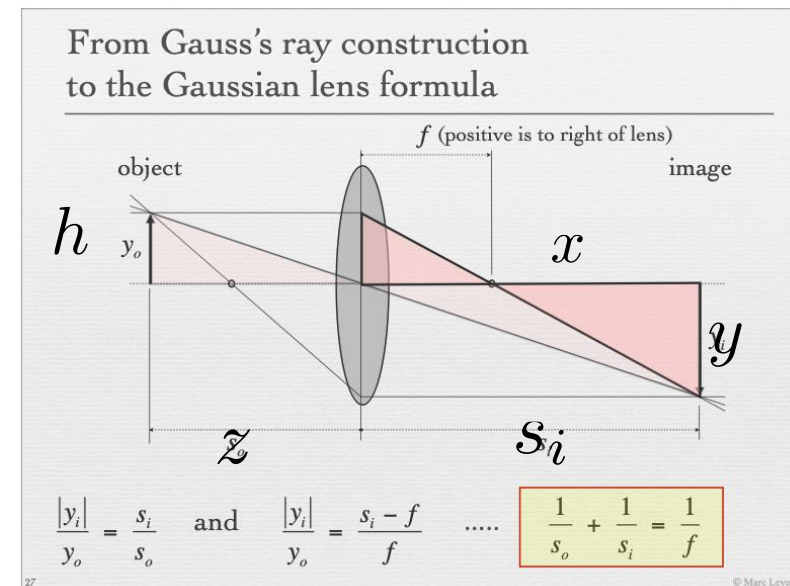

$$\frac{1}{s_o} + \frac{1}{s_i} = \frac{1}{f}$$

# Pinhole camera model

# Lens camera model

$y = s_i \frac{h}{z}$

$s_i = f + x$

Distance from sensor to lens

# Lens camera vs Pinhole camera

- For the lens camera model, we derived 
$$\frac{1}{z} + \frac{1}{s_i} = \frac{1}{f}$$
- As the depth goes to infinity  $z \rightarrow \infty$  we obtain  $s_i \rightarrow f$   
That is, lens with focal length  $f$  is equivalent to pinhole at distance  $f$

# Changing the focal length

- ◆ if the sensor size is constant, the field of view becomes smaller

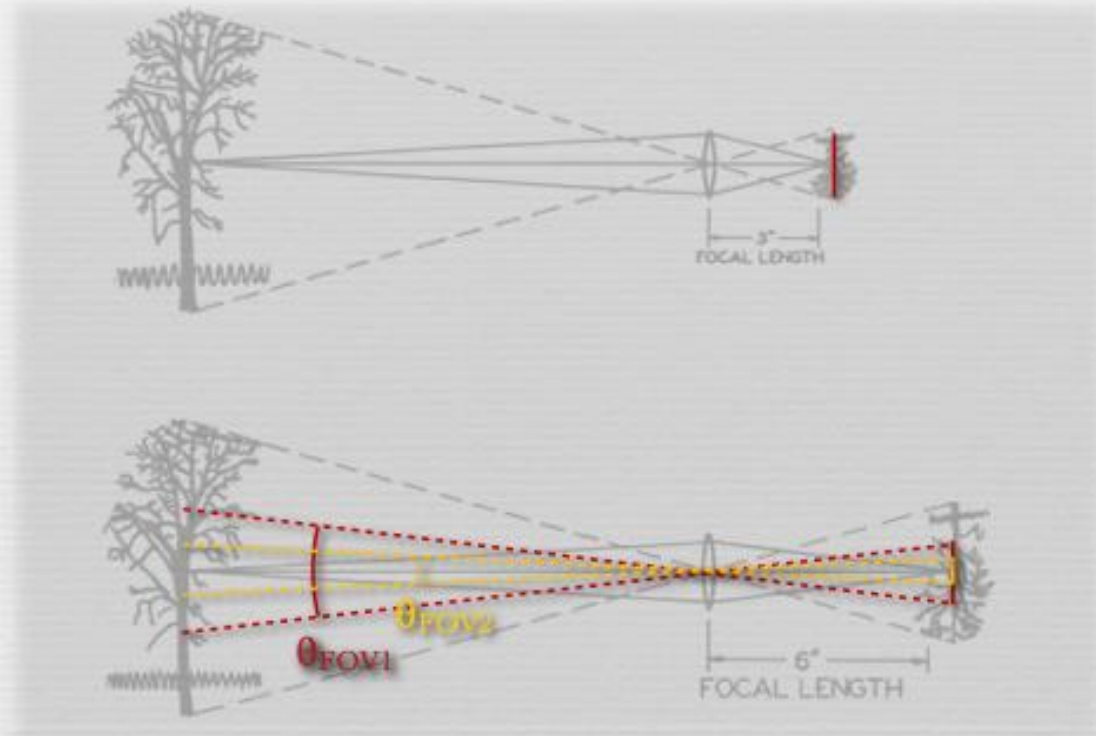

(Kingslake)

$$FOV = 2 \arctan (h / 2 f)$$

# Changing the sensor size

- ◆ if the sensor size is smaller, the field of view is smaller too
- ◆ smaller sensors either have fewer pixels, or smaller pixels, which are noisier

(Kingslake)

# Changing the focal length versus changing the viewpoint

---

(Kingslake)

wide-angle

telephoto and  
moved back

- ◆ changing the focal length lets us move back from a subject, while maintaining its size on the image
- ◆ but moving back changes perspective relationships

## Changing the focal length versus changing the viewpoint

---

- ◆ moving forward while shortening the focal length lets you keep objects at one depth the same size
- ◆ in cinematography, this is called the dolly-zoom, or “Vertigo effect”, after Alfred Hitchcock’s movie

### **Dolly-Zoom in Vertigo**

Tower at San Juan Batista

# Effect of focal length on portraits

---

- ◆ standard “portrait lens” is 85mm

wide angle

standard

telephoto

# Recap

---

- ◆ pinhole cameras compute correct linear perspectives
  - but dark
- ◆ lenses gather more light
  - but only one plane of scene is in focus
  - distance from lens to this plane is called the *focus distance*
  - change what's in focus by moving the sensor or lens
- ◆ *focal length* determines field of view
  - from wide angle to telephoto
  - depends on sensor size

**Questions?**

Let's formalize mathematically...

The goal now is to express the image formation process  
using a single **Projection Matrix**

# Imaging Geometry

**Object of Interest  
in World Coordinate  
System (U,V,W)**

# Imaging Geometry

## Camera Coordinate System (X,Y,Z).

- Z is optic axis
- Image plane located  $f$  units out along optic axis
- $f$  is called focal length

# Imaging Geometry

**Forward Projection onto image plane.  
3D  $(X, Y, Z)$  projected to 2D  $(x, y)$**

# Imaging Geometry

# Imaging Geometry

# Forward Projection

**We want a mathematical model to describe how 3D World points get projected into 2D Pixel coordinates.**

**Our goal: describe this sequence of transformations by a big matrix equation!**

# Backward Projection

**Note, much of vision concerns trying to derive backward projection equations to recover 3D scene structure from images (via stereo or motion)**

**But first, we have to understand forward projection...**

# Forward Projection

**3D-to-2D Projection**  
• perspective projection

We will start here in the middle, since we've already talked about this when discussing stereo.

# Basic Perspective Projection

Perspective Projection Eqns

$$x = f \frac{X}{Z}$$

$$y = f \frac{Y}{Z}$$

# Basic Perspective Projection

Perspective Projection Eqns

$$x = f \frac{X}{Z}$$
$$y = f \frac{Y}{Z}$$

derived via similar triangles rule

# Basic Perspective Projection

Perspective Projection Eqns

$$x = f \frac{X}{Z}$$

$$y = f \frac{Y}{Z}$$

derived via similar triangles rule

# Basic Perspective Projection

**So how do we represent this as a matrix equation?  
We need to introduce homogeneous coordinates.**

# Homogeneous Coordinates

Represent a 2D point  $(x,y)$  by a 3D point  $(x',y',z')$  by adding a “fictitious” third coordinate.

By convention, we specify that given  $(x',y',z')$  we can recover the 2D point  $(x,y)$  as

$$x = \frac{x'}{z'} \quad y = \frac{y'}{z'}$$

Note:  $(x,y) = (x,y,1) = (2x, 2y, 2) = (k x, k y, k)$   
for any nonzero  $k$  (can be negative as well as positive)

# Perspective Matrix Equation

(in Camera Coordinates)

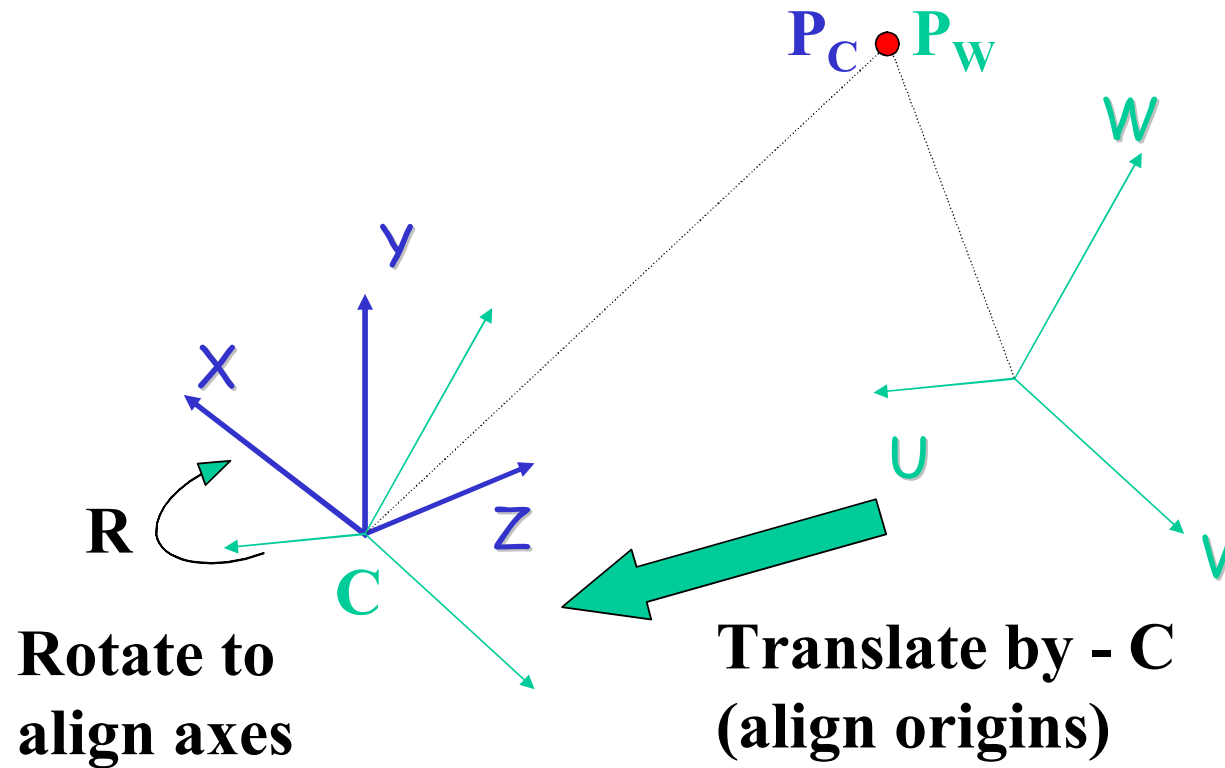

$$\begin{aligned} x &= f \frac{X}{Z} \\ y &= f \frac{Y}{Z} \end{aligned} \iff \begin{bmatrix} x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

# Forward Projection

**Rigid Transformation (rotation+translation)  
between world and camera coordinate systems**

# World to Camera Transformation

$$P_C = R ( P_W - C )$$

# Matrix Form, Homogeneous Coords

$$\mathbf{P}_C = \mathbf{R} (\mathbf{P}_W - \mathbf{C})$$

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 & -c_x \\ 0 & 1 & 0 & -c_y \\ 0 & 0 & 1 & -c_z \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

# Example: Simple Stereo System

Left camera located at world origin  $(0,0,0)$   
and camera axes aligned with world coord axes.

# Simple Stereo, Left Camera

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} \mathbf{1} & \mathbf{0} & \mathbf{0} & 0 \\ \mathbf{0} & \mathbf{1} & \mathbf{0} & 0 \\ \mathbf{0} & \mathbf{0} & \mathbf{1} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 & \mathbf{0} \\ 0 & 1 & 0 & \mathbf{0} \\ 0 & 0 & 1 & \mathbf{0} \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

**camera axes aligned  
with world axes**

**located at world  
position (0,0,0)**

$$= \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

# Simple Stereo, Right Camera

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} \mathbf{1} & \mathbf{0} & \mathbf{0} & 0 \\ \mathbf{0} & \mathbf{1} & \mathbf{0} & 0 \\ \mathbf{0} & \mathbf{0} & \mathbf{1} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 & -\mathbf{T}_x \\ 0 & 1 & 0 & \mathbf{0} \\ 0 & 0 & 1 & \mathbf{0} \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

camera axes aligned  
with world axes

located at world  
position  $(T_x, 0, 0)$

$$= \begin{bmatrix} 1 & 0 & 0 & -T_x \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

# Simple Stereo Projection Equations

## Left camera

$$\begin{bmatrix} x_l \\ y_l \\ 1 \end{bmatrix} \sim \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

$$x_l = f \frac{X}{Z} \quad y_l = f \frac{Y}{Z}$$

## Right camera

$$\begin{bmatrix} x_r \\ y_r \\ 1 \end{bmatrix} \sim \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & -T_x \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

$$x_r = f \frac{X - T_x}{Z} \quad y_r = f \frac{Y}{Z}$$

## Bob's sure-fire way(s) to figure out the rotation

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \cancel{1} & 0 & 0 & \cancel{-e_x} \\ \text{(forget about this} \\ \text{while thinking} \\ \text{about rotations)} \\ \cancel{0} & 0 & 0 & \cancel{1} \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

$$\mathbf{P}_C = \mathbf{R} \mathbf{P}_W$$

This equation says how vectors in the world coordinate system (including the coordinate axes) get transformed into the camera coordinate system.

# Figuring out Rotations

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix} \quad \mathbf{P}_C = \mathbf{R} \mathbf{P}_W$$

what if world x axis (1,0,0) corresponds to camera axis (a,b,c)?

$$\begin{pmatrix} \mathbf{a} \\ \mathbf{b} \\ \mathbf{c} \\ 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{1} \\ \mathbf{0} \\ \mathbf{0} \\ 1 \end{pmatrix} \quad \rightarrow \quad \begin{pmatrix} \mathbf{a} \\ \mathbf{b} \\ \mathbf{c} \\ 1 \end{pmatrix} = \begin{pmatrix} \mathbf{a} & r_{12} & r_{13} & 0 \\ \mathbf{b} & r_{22} & r_{23} & 0 \\ \mathbf{c} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \mathbf{1} \\ \mathbf{0} \\ \mathbf{0} \\ 1 \end{pmatrix}$$

we can immediately write down the first column of R!

## Figuring out Rotations

Alternative approach: sometimes it is easier to specify what camera X,Y,or Z axis is in world coordinates. Then do rearrange the equation as follows.

$$\mathbf{P}_C = \mathbf{R} \mathbf{P}_W \Rightarrow \mathbf{R}^{-1} \mathbf{P}_C = \mathbf{P}_W \Rightarrow \mathbf{R}^T \mathbf{P}_C = \mathbf{P}_W$$

$$\begin{pmatrix} r_{11} & r_{21} & r_{31} & 0 \\ r_{12} & r_{22} & r_{32} & 0 \\ r_{13} & r_{23} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

# Figuring out Rotations

and likewise with world Y axis and world Z axis...

same axis in camera coords

axis is world coords

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

world X axis (1,0,0)  
in camera coords

world Y axis (0,1,0)  
in camera coords

world Z axis (0,0,1)  
in camera coords

# Figuring out Rotations

and likewise with camera Y axis and camera Z axis...

same axis in camera coords

axis is world coords

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

camera X axis (1,0,0)  
in world coords

camera Y axis (0,1,0)  
in world coords

camera Z axis (0,0,1)  
in world coords

# Note: External Parameters also often written as R,T

$$\begin{pmatrix} X \\ Y \\ Z \\ 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 & -c_x \\ 0 & 1 & 0 & -c_y \\ 0 & 0 & 1 & -c_z \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} U \\ V \\ W \\ 1 \end{pmatrix}$$

$$\begin{aligned} & \mathbf{R} (\mathbf{P}_W - \mathbf{C}) \\ &= \mathbf{R} \mathbf{P}_W - \mathbf{R} \mathbf{C} \\ &= \mathbf{R} \mathbf{P}_W + \mathbf{T} \end{aligned} \begin{pmatrix} r_{11} & r_{12} & r_{13} & t_x \\ r_{21} & r_{22} & r_{23} & t_y \\ r_{31} & r_{32} & r_{33} & t_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

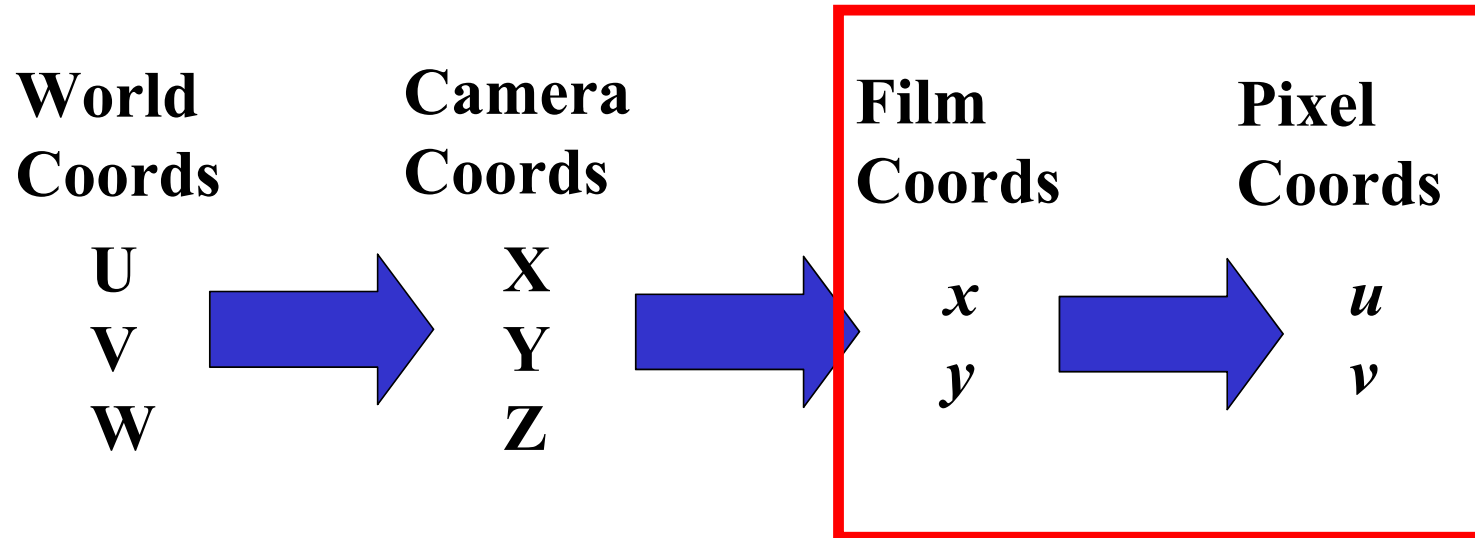

# Summary

**We now know how to transform 3D world coordinate points into camera coords, and then do perspective project to get 2D points in the film plane.**

**Next time: pixel coordinates**

# Intrinsic Camera Parameters

**Affine Transformation**

# Intrinsic parameters

- Describes coordinate transformation between film coordinates (projected image) and pixel array
- Film cameras: scanning/digitization
- CCD cameras: grid of photosensors

still in T&V section 2.4

# Intrinsic parameters (offsets)

film plane  
(projected image)

pixel array

$$u = f \frac{X}{Z} + o_x \quad v = f \frac{Y}{Z} + o_y$$

$o_x$  and  $o_y$  called image center or principle point

# Intrinsic parameters

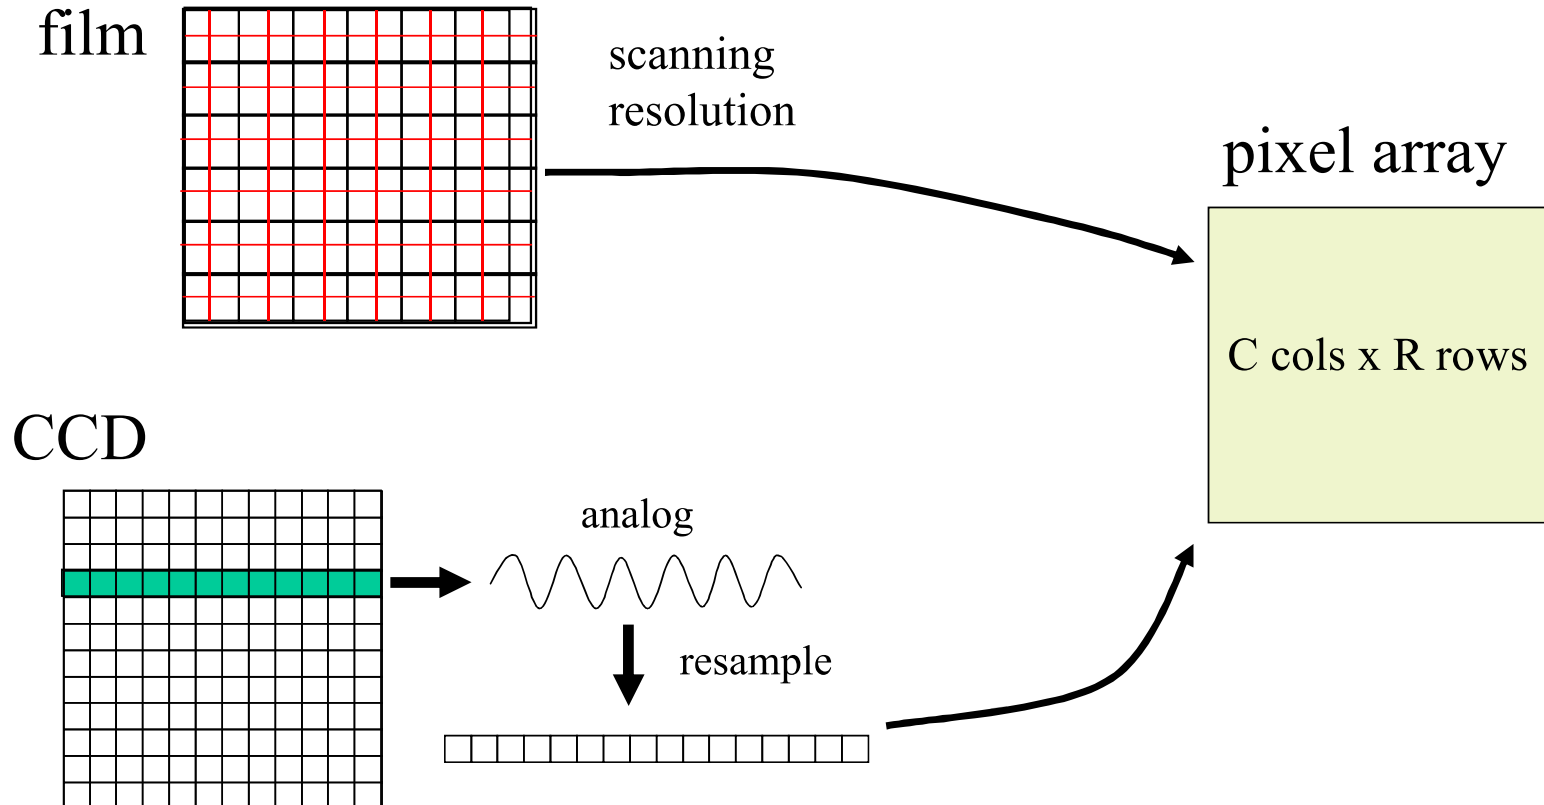

sometimes one or more coordinate axes are flipped (e.g. T&V section 2.4)

$$u = -f \frac{X}{Z} + o_x \quad v = -f \frac{Y}{Z} + o_y$$

# Intrinsic parameters (scales)

sampling determines how many rows/cols in the image

## Effective Scales: $s_x$ and $s_y$

$$u = \frac{1}{s_x} f \frac{X}{Z} + o_x \quad v = \frac{1}{s_y} f \frac{Y}{Z} + o_y$$

Note, since we have different scale factors in x and y, we don't necessarily have square pixels!

Aspect ratio is  $s_y / s_x$

# Perspective projection matrix

Adding the intrinsic parameters into the perspective projection matrix:

$$\begin{bmatrix} x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} f / s_x & 0 & o_x & 0 \\ 0 & f / s_y & o_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

To verify:

$$\begin{aligned} u &= \frac{x'}{z'} \\ v &= \frac{y'}{z'} \end{aligned} \quad \Rightarrow \quad \begin{aligned} u &= \frac{1}{s_x} f \frac{X}{Z} + o_x \\ v &= \frac{1}{s_y} f \frac{Y}{Z} + o_y \end{aligned}$$

## Note:

Sometimes, the image and the camera coordinate systems have opposite orientations: [the book does it this way]

$$\begin{aligned} f \frac{X}{Z} &= \overset{\downarrow}{-}(u - o_x)s_x \\ f \frac{Y}{Z} &= \overset{\downarrow}{-}(v - o_y)s_y \end{aligned} \quad \longrightarrow \quad \begin{bmatrix} x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} -f/s_x & 0 & +o_x & 0 \\ 0 & -f/s_y & +o_y & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

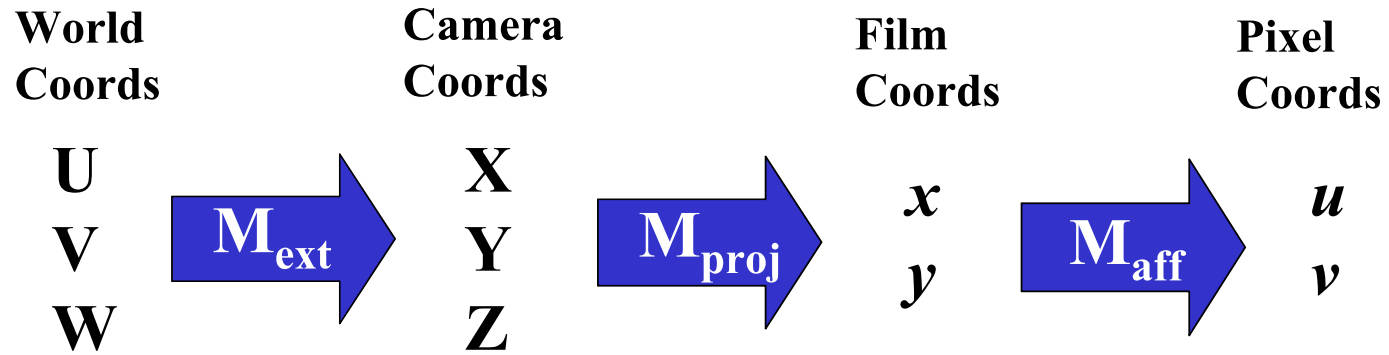

## Note 2

In general, I like to think of the conversion as a separate 2D affine transformation from film coords (x,y) to pixel coordinates (u,v):

$$\begin{pmatrix} u' \\ v' \\ w' \end{pmatrix} = \underbrace{\begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ 0 & 0 & 1 \end{pmatrix}}_{\mathbf{M}_{\text{aff}}} \underbrace{\begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}}_{\mathbf{M}_{\text{proj}}} \begin{bmatrix} X \\ Y \\ Z \\ 1 \end{bmatrix}$$

$$\mathbf{u} = \mathbf{M}_{\text{int}} \mathbf{P}_C = \mathbf{M}_{\text{aff}} \mathbf{M}_{\text{proj}} \mathbf{P}_C$$

# Summary : Forward Projection

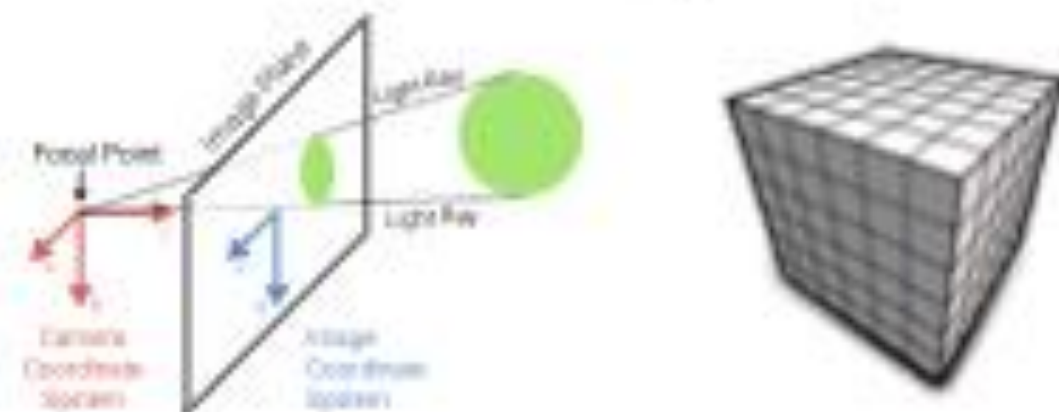

# Projection Models

Perspective

Weak Perspective / Orthographic

Increasing Focal Length / Distance from Camera

# Orthographic Projection

**Orthographic projection** of a 3D point  $\mathbf{x}_c \in \mathbb{R}^3$  to pixel coordinates  $\mathbf{x}_s \in \mathbb{R}^2$ :

- ▶ The  $x$  and  $y$  axes of the camera and image coordinate systems are shared
- ▶ Light rays are parallel to the  $z$ -coordinate of the camera coordinate system
- ▶ During projection, the  $z$ -coordinate is dropped,  $x$  and  $y$  remain the same
- ▶ Remark: the  $y$  coordinate is not shown here for clarity, but behaves similarly

# Scaled Orthographic Projection

In practice, world coordinates (which may measure dimensions in meters) must be scaled to fit onto an image sensor (measuring in pixels)  $\Rightarrow$  **scaled orthography**:

$$\mathbf{x}_s = \begin{bmatrix} s & 0 & 0 \\ 0 & s & 0 \end{bmatrix} \mathbf{x}_c \quad \Leftrightarrow \quad \bar{\mathbf{x}}_s = \begin{bmatrix} s & 0 & 0 & 0 \\ 0 & s & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \bar{\mathbf{x}}_c$$

Remark: The unit for  $s$  is px/m or px/mm to convert metric 3D points into pixels.

Under orthography, structure and motion can be estimated simultaneously using factorization methods (e.g., via singular value decomposition).
